## Graph width-parameters

- tree-width (Halin 1976, Robertson and Seymour 1984)
- branch-width (Robertson and Seymour 1991)
- carving-width (Seymour and Thomas 1994)
- clique-width (Courcelle and Olariu 2000)
- rank-width (Oum and Seymour 2006)
- boolean-width (Bui-Xuan, Telle, Vatshelle 2011)
- maximum matching-width (Vatshelle 2012)

## Tree-width

- tree-width (Halin 1976, Robertson and Seymour 1984)

A measure of how "tree-like" the graph is.

## A tree-decomposition of a graph $G$ is <br> a pair $\left(T,\left\{X_{t}\right\}_{t \in V(T)}\right)$ consisting of a tree $T$ and a family $\left\{X_{t}\right\}_{t \in V(T)}$ of subsets $X_{t}$ of $V(G)$,

called bags, satisfying the following three conditions:

1. each vertex of $G$ is in at least one bag,
2. for each edge $u v$ of $G$, there exists a bag that contains both $u$ and $v$,
3. if $X_{i}$ and $X_{j}$ both contain a vertex $v$, then all bags $X_{k}$ in the path between $X_{i}$ and $X_{j}$ contain $v$ as well.

 called bags, satisfying the following three conditions:
4. each vertex of $G$ is in at least one bag,
5. for each edge $u v$ of $G$, there exists a bag that contains both $u$ and $v$,
6. if $X_{i}$ and $X_{j}$ both contain a vertex $v$, then all bags $X_{k}$ in the path between $X_{i}$ and $X_{j}$ contain $v$ as well.

The width of a tree-decomposition $\left(T,\left\{X_{t}\right\}_{t \in V(T)}\right)$ is max $\left|X_{t}\right|-1$.
The tree-width of a graph $G$, denoted by $\operatorname{tw}(G)$, is the minimum width over all possible tree-decompositions of $G$.

## Examples

- tree-width $\leq 1 \Leftrightarrow$ a forest $\Leftrightarrow$ no cycle
- tree-width $\leq 2 \Leftrightarrow$ a series-parallel graph
$\Leftrightarrow$ no $K_{4}$ minor

## Examples

- tree-width $\leq 1 \Leftrightarrow$ a forest $\Leftrightarrow$ no cycle
- tree-width $\leq 2 \Leftrightarrow$ a series-parallel graph
$\Leftrightarrow$ no $K_{4}$ minor

- The tree-width of a $k \times k$ grid is $k$.
- The tree-width of $K_{n}$ is $n-1$.

## Algorithm using tree-decomposition

## Exercise

Given a tree-decomposition of width $t$ of a graph $G$, 3 -COLORABILITY can be solved in time $O\left(t 3^{t} n\right)$.

## Algorithm using tree-decomposition

## Exercise

## Algorithm using tree-decomposition

## Easy exercise

Given a tree-decomposition of width $t$ of a graph $G$, 3 -COLORABILITY can be solved in time $O\left(t 3^{t} n\right)$.

## Difficult exercise

Given a tree-decomposition of width $t$ of a graph $G$, Minimum Dominating Set Problem can be solved in time $O\left(4^{t} n\right)$.

## Algorithm using tree-decomposition

## Difficult exercise

Given a tree-decomposition of width $t$ of a graph $G$, Minimum Dominating Set Problem can be solved in time $O\left(4^{t} n\right)$.

- In dominating set $D$
- Dominated by D
- Not in D, but do not have to be dominated by D (will be dominated later)
- TRUE / FALSE $\rightarrow$ the size of D
(if D is not a dominating set, then $\infty$ )

## Algorithm using tree-decomposition

## Theorem (van Rooij, Bodlaender, Rossmanith 2009)

Minimum Dominating Set Problem can be solved in time $O\left(3^{t} n\right)$ when a graph and its tree-decomposition of width $t$ is given.

## Theorem (Lokshtanov, Marx, Saurabh 2011)

Minimum Dominating Set Problem cannot be solved in time $O\left((3-\varepsilon)^{t} n\right)$ where $t$ is the tree-width of the given graph.

## New width-parameter

Maximum matching width (mmw)

## Theorem (Vatshelle 2012)

For every graph $G$,

$$
\operatorname{mmw}(G) \leq t w(G)+1 \leq 3 \mathrm{mmw}(G)
$$

A graph $G$ has bounded tree-width if and only if $G$ has bounded mm-width.

## Algorithm using mmw

## Theorem (J., Sæther, Telle 2015)

Minimum Dominating Set Problem can be solved in time $O\left(8^{m} n\right)$ when a graph and its mm -decomposition of mm-width $m$ is given.

Using tree-width: $O\left(3^{t} n\right)$ Using mm-width: $O\left(8^{m} n\right)$

Our algorithm is faster when $8^{m}<3^{t}$, that is,

$$
1.893 \mathrm{mmw}(G)<t w(G)
$$

Note that for every graph $G$,

$$
m m w(G) \leq t w(G)+1 \leq 3 \operatorname{mmw}(G)
$$

## What if only a graph is an input?

## Theorem (Oum, Seymour 2006)

Given a graph $G$, a branch-decomposition over $V(G)$ of mmwidth at most $3 m m w(G)+1$ can be found in time $O^{*}\left(2^{3 \operatorname{mmw}(G)}\right)$.
Runtime: $O^{*}\left(8^{m}\right)=O^{*}\left(8^{3 m m w(G)}\right)$

## Theorem (Amir 2010)

Given a graph $G$, a tree-decomposition over $V(G)$ of width at most $3.67 t w(G)$ can be found in time $O^{*}\left(2^{3.7 t w(G)}\right)$.

Runtime : $O^{*}\left(3^{t}\right)=O^{*}\left(3^{3.67 t w(G)}\right)$

## What if only a graph is an input?

## Theorem (Oum, Seymour 2006)

Given a graph $G$, a branch-decomposition over $V(G)$ of mmwidth at most $3 \mathrm{mmw}(G)+1$ can be Our algorithm is faster Runtime : $O^{*}\left(8^{m}\right)=O^{*}\left(8^{3 m m w(G)}\right)$ if an input graph $G$

## Theorem (Amir 2010)

$1.55 \mathrm{mmw}(G)<t w(G)$ most $3.67 t w(G)$ can be found in time $O^{*}\left(2^{3.7 t w^{\prime}(G)}\right)$.

Runtime : $O^{*}\left(3^{t}\right)=O^{*}\left(3^{3.67 t w(G)}\right)$

## Open questions

## Theorem (J., Sæther, Telle 2015) <br> Minimum Dominating Set Problem can be solved in time $O\left(8^{m} n\right)$ when a graph and its mm -decomposition of mm -width $m$ is given.

- Improve $O\left(8^{m} n\right)$ or show that it is tight
- Other problems
- Other width-parameters

## Theorem (van Rooij, Bodlaender, Rossmanith 2009)

Minimum Dominating Set Problem can be solved in time $O\left(3^{t} n\right)$ when a graph and its tree-decomposition of width $t$ is given.

## Theorem (J., Sæther, Telle 2015)

Minimum Dominating Set Problem can be solved in time $O\left(8^{m} n\right)$ when a graph and its mm -decomposition of mm -width $m$ is given.

Our algorithm is faster when $8^{m}<3^{t}$, that is, $1.893 \mathrm{mmw}(G)<t w(G)$.

## Thank you

## New characterization

For any $k \geq 2$, a graph $G$ on vertices $v_{1}, v_{2}, \ldots, v_{n}$ has tree-width (mm-width, branch-width) at most $k$ if and only if there are subtrees $T_{1}, T_{2}, \ldots, T_{n}$ of a tree $T$ where all internal vertices have degree 3
such that 1 ) if $v_{i} v_{j} \in E(G)$, then $T_{i}$ and $T_{j}$ have at least one vertex (vertex, edge) of $T$ in common,
2) for each vertex (edge, edge) of $T$, there are at most $k-1$ (at most $k$, at most $k$ ) subtrees containing it.
